EPFL

ER+

SER modulators - inhibit ER transcriptional activity in the breast (*tamoxifen, raloxifene*)

SER degraders – reduce ability of SERD-bound ER to translocate to the nucleus -> ER-SERD complex is unable to facilitate transcription of ER-regulated genes -> SERD-bound ER undergoes degradation as a consequence of impaired mobility (*fulvestrant*)

Aromatase inhibitors - block estrogen production by inhibiting the aromatization of androgens to estrogens (*anastrozole*)

Patients are uniformly treated with drugs that inhibit the **estrogen receptor**, which have highly improved patient survival but some patients ultimately become **resistant and tumor tends to relapse**

Daria Matvienko, UPBRI
